

Ubiquitin

Modifying Protein

Alternate Names: Ribosomal Protein S27a, CEP80, UBA80, UBCEP1, UBCEP80, HUBCEP80, RPS27A

Cat. No. **60-0001-010**

Lot. No. **30181**

Quantity: 10 mg

Storage: 4°C

FOR RESEARCH USE ONLY

NOT FOR USE IN HUMANS

CERTIFICATE OF ANALYSIS - Page 1 of 2

Background

Ubiquitin is a highly conserved protein that plays a key role in the ubiquitylation pathway. Ubiquitin is found only in eukaryotic organisms throughout which it shows strong sequence conservation (Wilkinson, 1995). The ubiquitin protein is present in all cell types and found either in free form or conjugated to proteins through a covalent bond between its C-terminal glycine and the ϵ -amino group of lysine residues; a process known as ubiquitination or ubiquitylation. Ubiquitylation is an essential cellular process affected by a multi-enzyme cascade involving three classes of enzyme known as activating enzymes (E1s), conjugating enzymes (E2s) and protein ligases (E3s). E1 activates ubiquitin in an ATP-dependent manner resulting in the formation of a thioester linkage between the carboxy terminus of ubiquitin and the E1 enzyme. Sequential, transient thioester bonds are then generated between the carboxy terminus of ubiquitin and specific cysteines of the E2 and – in some instances – of the E3 enzymes (Bonifacino and Weissman, 1998). Ultimately, an isopeptide bond is formed between the glycine carboxy terminus of ubiquitin and an ϵ -amino group of a lysine residue on a target protein (mono-ubiquitylation) or on another ubiquitin resulting in the generation of chains of ubiquitin (poly-ubiquitylation) which may be Lys-6, Lys-11, Lys-27, Lys-29, Lys-33, Lys-48 or Lys-63 linked (Komander, 2009). Ubiquitin chains may also be linear in nature, formed via the conjugation of the activated glycine residue of one ubiquitin moiety to the α -amino group at the N-terminus of another ubiquitin. Specific ubiquitin chain types adopt distinct conformations which are likely to be important in respect of their functions. Although some functionalities have been determined for certain chain types, the

Physical Characteristics

Species: bovine

Source: erythrocytes

Quantity: 10 mg

Formulation: powder (lyophilized from protein dissolved in H₂O); rehydrate as required

Molecular Weight: ~8.6 kDa

Purity: >95% by InstantBlue™ SDS-PAGE

Stability/Storage: 1 year lyophilized at 4°C; 6 months rehydrated at -20°C; aliquot as required

Protein Sequence:

**MQIFVKTLTGKITLEVEPSDTIENVKAKIQD
KEGIPPDQQRLLIFAGKQLEDGRTLSDY
NIQKESTLHLVLR**GG

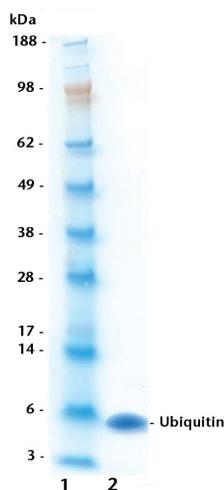

Ubiquitin (regular text): Start **bold italics** (amino acid residues 1-76)

Accession number: P62990.1

Quality Assurance

Purity:

4-12% gradient SDS-PAGE
InstantBlue™ staining
lane 1: MW markers
lane 2: 1 μ g Ubiquitin

E1-Ubiquitin Thioester Loading Assay:

The activity of ubiquitin was validated by loading ubiquitin onto the active cysteine of His-UBE1. Incubation of the His-UBE1 enzyme in the presence of ubiquitin and ATP at 30°C was compared at two time points, T₀ and T₁₀ minutes. Sensitivity of the ubiquitin/His-UBE1 thioester bond to the reducing agent DTT was confirmed.

Background

Continued from page 1

roles of many of these structures remain to be fully elucidated (Komander, 2009). In respect of Lys-48 and Lys-63 chain types, some key roles have been determined: Lys-48 linked chains direct substrates towards 26S proteasome mediated degradation (Verma *et al.*, 2004), whereas roles for Lys-63 linked chains include activation of the NF- κ B pathway and mediation of steps of the DNA repair pathway (DiFiglia *et al.*, 1997; Rahighi *et al.*, 2009; Tokunaga *et al.*, 2009). Interestingly, proteins constituting many types of pathological inclusion bodies may be poly-ubiquitylated, however these may be resistant to degradation. For example poly-ubiquitylated huntingtin accumulates at neuronal intranuclear inclusions (NIIs) and dystrophic neurites in the striatum and cortex of patients affected by Huntington's disease (DiFiglia *et al.*, 1997).
